Operational research for urban solar development

"Regional PV production estimation from open data"

Companion list to the project instructions

In the tables, **n** is your student number and **k** your pair number. Your **student number n** selects your system for part A. Your **pair number k** and your **region** select your data for part B. Use both numbers in the names of your files, for example `student_n_acestimation.csv` and `pair_k_region.csv`. Groups 9* and 11* write `9b` and `11b` in file names, for example `pair_9b_region.csv`.

The data of each region sits in `project/regions/` in the course repository, one folder per region. The project notebook finds the folder of your region from your pair number. Corse lies outside the RTE grid: its reference series comes from EDF SEI. Bretagne is studied by two groups, 9 and 9*, and Île-de-France by two groups, 11 and 11*. Groups on the same region work independently on the same data. Group 11* is one student: the rules of a pair apply, with part B and the oral done alone.
